

ABSTRACT

User interface apparatus, and an associated method, for facilitating viewing of display indicia by a user of reduced visual acuity. A user display is divided into a first part and a second part. A screen manager operates to cause display at the first part of the user display a sequence
5 of characters in a regular, or small display size. One or more of the characters of the sequence are also caused by the manager to be displayed at the second part of the user display. When displayed at the second part, the character is displayed in enlarged size to facilitate its perception by the user.
